Living in the Environment

Popularized by such best-selling authors as Michael Pollan, Barbara Kingsolver, and Eric Schlosser, a growing food movement urges us to support sustainable agriculture by eating fresh food produced on local family farms. But many low-income neighborhoods and communities of color have been systematically deprived of access to healthy and sustainable food. These communities have been actively prevented from producing their own food and often live in "food deserts" where fast food is more common than fresh food. Cultivating Food Justice describes their efforts to envision and create environmentally sustainable and socially just alternatives to the food system. Bringing together insights from studies of environmental justice, sustainable agriculture, critical race theory, and food studies, Cultivating Food Justice highlights the ways race and class inequalities permeate the food system, from production to distribution to consumption. The studies offered in the book explore a range of important issues, including agricultural and land use policies that systematically disadvantage Native American, African American, Latino/a, and Asian American farmers and farmworkers; access problems

in both urban and rural areas; efforts to create sustainable local food systems in low-income communities of color; and future directions for the food justice movement. These diverse accounts of the relationships among food, environmentalism, justice, race, and identity will help guide efforts to achieve a just and sustainable agriculture.

Fish are one of the most important global food sources, supplying a significant share of the world's protein consumption. From stocks of wild Alaskan salmon and North Sea cod to entire fish communities with myriad species, fisheries require careful management to ensure that stocks remain productive, and mathematical models are essential tools for doing so. *Fish Ecology, Evolution, and Exploitation* is an authoritative introduction to the modern size- and trait-based approach to fish populations and communities. Ken Andersen covers the theoretical foundations, mathematical formulations, and real-world applications of this

powerful new modeling method, which is grounded in the latest ecological theory and population biology. He begins with fundamental assumptions on the level of individuals and goes on to cover population demography and fisheries impact assessments. He shows how size- and trait-based models shed new light on familiar fisheries concepts such as maximum sustainable yield and fisheries selectivity—insights that classic age-based theory can't provide—and develops novel evolutionary impacts of fishing. Andersen extends the theory to entire fish communities and uses it to support the ecosystem approach to fisheries management, and forges critical links between trait-based methods and evolutionary ecology. Accessible to ecologists with a basic quantitative background, this incisive book unifies the thinking in ecology and fisheries science and is an indispensable reference for anyone seeking to apply size- and trait-based models to fish demography, fisheries impact assessments, and fish evolutionary ecology.

ONE OF THE NEW YORK TIMES BOOK REVIEW'S 10 BEST BOOKS OF THE YEAR A major book about the future of the world, blending intellectual and natural history and field reporting into a powerful account of the mass extinction unfolding before our eyes Over the last half a billion years, there have been five mass extinctions, when the diversity of life on earth suddenly and dramatically contracted. Scientists around the world are currently monitoring the sixth extinction, predicted to be the most devastating extinction event since the asteroid impact that wiped out the dinosaurs. This time around, the cataclysm is us. In *The Sixth Extinction*, two-time winner of the National Magazine Award and *New Yorker* writer Elizabeth Kolbert draws on the work of scores of researchers in half a dozen disciplines, accompanying many of them into the field: geologists who study deep ocean cores, botanists who follow the tree line as it climbs up the Andes, marine biologists who dive off the Great Barrier Reef. She introduces us to a dozen species, some already gone, others facing

extinction, including the Panamian golden frog, staghorn coral, the great auk, and the Sumatran rhino. Through these stories, Kolbert provides a moving account of the disappearances occurring all around us and traces the evolution of extinction as concept, from its first articulation by Georges Cuvier in revolutionary Paris up through the present day. The sixth extinction is likely to be mankind's most lasting legacy; as Kolbert observes, it compels us to rethink the fundamental question of what it means to be human.

Technology has become increasingly important to both the function and our understanding of the justice process. Many forms of criminal behaviour are highly dependent upon technology, and crime control has become a predominantly technologically driven process – one where ‘traditional’ technological aids such as fingerprinting or blood sample analysis are supplemented by a dizzying array of tools and techniques including surveillance devices and DNA profiling. This book offers the first comprehensive and holistic overview of global research on technology, crime and justice. It is divided into five parts, each corresponding with the key stages of the offending and justice process: Part I addresses the current conceptual understanding of technology within academia and the criminal justice system; Part II gives a comprehensive overview of the current relations between technology and criminal behaviour; Part III explores the current technologies within crime

control and the ways in which technology underpins contemporary formal and informal social control; Part IV sets out some of the fundamental impacts technology is now having upon the judicial process; Part V reveals the emerging technologies for crime, control and justice and considers the extent to which new technology can be effectively regulated. This landmark collection will be essential reading for academics, students and theorists within criminology, sociology, law, engineering and technology, and computer science, as well as practitioners and professionals working within and around the criminal justice system.

Scores of talented and dedicated people serve the forensic science community, performing vitally important work. However, they are often constrained by lack of adequate resources, sound policies, and national support. It is clear that change and advancements, both systematic and scientific, are needed in a number of forensic science disciplines to ensure the reliability of work, establish enforceable standards, and promote best practices with consistent application. Strengthening Forensic Science in the United States: A Path Forward provides a detailed plan for addressing these needs and suggests the creation of a new government entity, the National Institute of Forensic Science, to establish and enforce standards within the forensic science community. Science and technology are embedded in virtually every aspect of modern life. As a result, people face an increasing need to integrate information from science with their personal values and other considerations as they make important life decisions about medical care, the safety of foods, what to do about climate change, and many other issues. Communicating science effectively, however, is a complex task and an acquired skill. Moreover, the approaches to communicating science that will be most effective for specific audiences and circumstances are not obvious. Fortunately, there is an expanding science base from diverse disciplines that can support science communicators in making these determinations. Communicating Science Effectively offers a research agenda for science communicators and researchers seeking to apply this

Despite an overwhelming scientific consensus, climate change remains one of the most controversial issues of our time. Focusing on the rhetoric that surrounds the issue of climate change, this groundbreaking book analyses why the debate continues to rage and examines how we should argue when winning the argument really matters. Going beyond routine condemnations of the wildest statements made by religious fundamentalists or spokespeople for fossil fuel interests, the book explains the mutually exacerbating problems that permit many of us greet catastrophic predictions with an equivocal shrug. It argues that the argumentative situation around climate change makes a certain kind of skepticism - "fair-minded skepticism" - not only possible but likely. The book also strikes a hopeful note, reminding us that people do change their minds in response to effective argumentation that appeals to deeply shared values. Offering new insight into an ongoing academic discussion about the nature of argument and how it can be undertaken more effectively and ethically, as well as a new perspective

1968 looks like it'll be a pretty good year for Jaynell Lambert. The town's going to pave the dirt road she lives on, her girly-girl sister, Racine, isn't driving her completely crazy, and Grandpap has just moved in with his new emerald green Cadillac convertible. Jaynell and Grandpap have something special. But why won't Grandpap tell her the reason he visits with the dirt-poor Pickens family on the other side of town? When Jaynell finds out Grandpap's secret, the legacy of an old man transforms a family, and a town. "At once gritty and poetic, stark and sentimental . . . a solid page turner. Haitian writers have made profound contributions to debates about the converging paths of political and natural histories, yet their reflections on the legacies of colonialism, imperialism, and neoliberalism are often neglected in heated disputes about the future of human life on the planet. The 2010 earthquake only exacerbated this contradiction. Despite the fact that Haitian authors have long treated the connections between political violence, precariousness, and ecological degradation, in media coverage around the world, the earthquake would have suddenly exposed scandalous conditions on the ground in Haiti. This book argues that contemporary Haitian literature historicizes the political and environmental problems brought to the surface by the earthquake by building on texts of earlier generations, especially at the end of the Duvalier era and its aftermath.
