## **The Great Devonian Controversy**

This book discusses the two different cellular approaches that are pursued in regenerative medicine: cell therapy and tissue engineering. It examines in detail the therapeutic application of hematopoietic stem cells in marrow regeneration, multi-potent mesenchymal stem cells (MSCs), also referred to as mesenchymal stromal cells. The interest in MSCs can be seen in more than 150 clinical trials, some of which have progressed to Phase III, despite the cells' limited

differentiation potential. The book also explores how embryonic stem (ES) cells, being pluripotent in nature, can resolve some of the problems associated with adult stem cells, yet entail other challenges like risks of teratoma formation and immune rejection. A separate chapter deals with the role of noncoding RNAs in neuronal commitment of induced pluripotent stem (iPS) cells. Chapters like “Cord blood banking in India and the global scenario”; “3D bioprinting of tissue” and others will make this book an extremely interesting read for all students, researchers and clinicians working in the area of regenerative medicine/stem cells. The book is broadly divided into two parts, the first of which is devoted to basic information on stem cells, and the second of which addresses potential clinical applications in the areas of hematology, cardiology, orthopedic and immune suppression, etc.

An@tomedica: General Anatomy - Principles and Applications integrates both regions and systems in a concise and easily understandable text. This is a practically orientated book that introduces general anatomy concepts to medical, nursing and allied health students. Containing essential information for immediate comprehension of anatomical concepts and principles, over 700 clear illustrations, diagrams and real pictures of dissections further assist clinical understanding.

The eye is a complex sensory organ, which enables visual perception of the world. Thus the eye has several tissues that do different tasks. One of the most basic aspects of eye function is the sensitivity of cells to light and its transduction through the optic nerve to the brain. Different organisms use different ways to

achieve these tasks. In this sense, eye function becomes a very important evolutionary aspect as well. This book presents the different animal models that are commonly used for eye research and their uniqueness in evaluating different aspects of eye development, evolution, physiology and disease. \* Presents information on the major animal models used in eye research including invertebrates and vertebrates \* Provides researchers with information needed to choose between model organisms \* Includes an introductory chapter on the different types of eyes, stressing possible common molecular machinery

Science "After a superficial first glance, most readers of good will and broad knowledge might dismiss [this book] as being too much about too little. They would be making one of the biggest mistakes in their intellectual lives. . . . [It] could become one of our century's key documents in understanding science and its history."—Stephen Jay Gould, *New York Review of Books* "Surely one of the most important studies in the history of science of recent years, and arguably the best work to date in the history of geology."—David R. Girls in Science is valuable for more than issues of gender equity. As their work progressed, the authors realized what they were learning could be adapted to help with equitable teaching for other groups of students special-needs , English language learners, and ethnic and racial minorities, for example.
