Now in its 19th edition, this comprehensive directory details companies active in multimedia, which continues to evolve alongside the industry that it tracks. The text contains details of approximately 16,000 companies. Entries include company descriptions and classifications by activity, sector, platform, product type, size, turnover and more. The database section is indexed. This year articles from industry leaders and shapers, as well as interviews with heads of trend-setting companies and a round-up of statistics, should make this a useful item for professionals in the industry, and those who purchase multimedia professionally.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of

Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

Great news for multitasking middle school teachers: Science educators Terry Shiverdecker and Jessica Fries-Gaither can help you blend inquiry-based science and literacy instruction to support student learning and maximize your time. Several unique features make *Inquiring Scientists, Inquiring Readers in Middle School* a valuable resource:

- Lessons integrate all aspects of literacy—reading, writing, speaking, listening, and viewing. The texts are relevant nonfiction, including trade books, newspaper and magazine articles, online material, infographics, and even videos.
- A learning-cycle framework helps students deepen their understanding with data collection and analysis before reading about a concept.
- Ten investigations support current standards and encompass life, physical, and Earth and space sciences. Units range from “Chemistry, Toys, and Accidental Inventions” to “Thermal Energy: An Ice Cube’s Kryptonite!”
- The authors have made sure the book is teacher-friendly. Each unit comes with scientific background, a list of common misconceptions, an annotated text list, safety considerations, differentiation strategies, reproducible student pages, and assessments. This middle school resource is a follow-up to the authors’ award-winning *Inquiring Scientists, Inquiring Readers* for grades 3–5, which one reviewer called “very thorough, and any science teacher’s dream to read.” The book will change the way you think about engaging your students in science and literacy.

Science, engineering, and technology permeate nearly every facet of modern life and hold the key to solving many of humanity's most pressing current and future challenges. The United States' position in the global economy is declining, in part because U.S. workers lack fundamental knowledge in these fields. To address the critical issues of U.S. competitiveness and to better prepare the workforce, A Framework for K-12 Science Education proposes a new approach to K-12 science education that will capture students' interest and provide them with the necessary foundational knowledge in the field. A Framework for K-12 Science Education outlines a broad set of expectations for students in science and engineering in grades K-12. These expectations will inform the development of new standards for K-12 science education and, subsequently, revisions to curriculum, instruction, assessment, and professional development for educators. This book identifies three

dimensions that convey the core ideas and practices around which science and engineering education in these grades should be built. These three dimensions are: crosscutting concepts that unify the study of science through their common application across science and engineering; scientific and engineering practices; and disciplinary core ideas in the physical sciences, life sciences, and earth and space sciences and for engineering, technology, and the applications of science. The overarching goal is for all high school graduates to have sufficient knowledge of science and engineering to engage in public discussions on science-related issues, be careful consumers of scientific and technical information, and enter the careers of their choice. A Framework for K-12 Science Education is the first step in a process that can inform state-level decisions and achieve a research-grounded basis for improving science instruction and learning across the country. The book will guide standards developers, teachers, curriculum designers, assessment developers, state and district science administrators, and educators who teach science in informal environments.

The establishment and maintenance of these interactions and their contributions to the health and survival of all partners relies on continuous cell-to-cell communication between them. This dialogue may be concerned with all aspects of the biology of both partners. The book includes chapters devoted to exploring, explaining, and exposing these dialogues across a broad spectrum of plant and animal eukaryotes to a broad field of biologists. Being literate in an academic discipline means more than simply being able to read and comprehend text; it means you can think, speak, and write as a historian, scientist, mathematician, or artist. Doug Buehl strips away the one-size-fits-all approach to content area literacy and presents a much-needed instructional model for disciplinary literacy, showing how to mentor middle and high school learners to become "academic insiders" who are college and career ready. This thoroughly revised second edition of *Developing Readers in the Academic Disciplines* shows how to help students adjust their thinking to comprehend a range of complex texts that fall outside their reading comfort zones. This book --a natural companion to Buehl's *Classroom Strategies for Interactive Learning*, which has been bolstering student comprehension for almost three decades--provides the following supports for teachers: Instructional tools that adapt generic literacy practices to discipline-specific variations Strategies for frontloading instruction to activate and build background knowledge New approaches for
