Cal/OSHA Pocket Guide for the Construction Industry

This title was first published in 2002: This field guide assesses two views of human error - the old view, in which human error becomes the cause of an incident or accident, or the new view, in which human error is merely a symptom of deeper

trouble within the system. The two parts of this guide concentrate on each view, leading towards an appreciation of the new view, in which human error is the starting point of an investigation, rather than its conclusion. The second part of this guide focuses on the circumstances which unfold around people, which causes their assessments and actions to change accordingly. It shows how to "reverse engineer" human error, which, like any other component, needs to be put back together in a mishap investigation.

Author George Swartz addresses a number of preventative measures, including fixed fire systems and fire safety, materials storage, handrailing and ladders, employee training, forklifts, methods for lockout/tagout procedures, dock hazards and safeguards, and more.
