This is a comprehensive edition of Maxwell's manuscript papers published virtually complete and largely for the first time.

The Examination Statutes, Rev. to June, 17

This book gathers the proceedings of the Energy and Sustainability 2018 Symposium (EAS 2018) held in Windsor, Canada in June 2018. It brings together the state-of-the-art on specific aspects of the current energy status, and covers a wide range of energy and engineering systems, from internal combustion engines to electric vehicles, from the atmosphere, solar and wind, to underground geothermal and underwater turbines and energy storage. The book demonstrates how conventional internal combustion engines have advanced dramatically in terms of both performance and emissions over the past century. It also studies how life-supporting elements, such as water and greenhouses, must be prioritized and protected to ensure a sustainable future. The book offers a valuable source of information for future leaders, engineers, environmentalists, social forerunners, and decision-makers alike. It also provides a reference guide for both undergraduate and graduate students in engineering, the natural and social sciences, business and economics.

The Two Degrees Dangerous Limit for Climate Change

The Medico-chirurgical Review

Paper

This book is about the history, present and future of one the most important policy ideas of the modern era – that there is a single, global dangerous amount of climate change. That dangerous amount of climate change is imagined as two degrees centigrade of global warming above the pre-industrial average. Though the two degree idea is based on the value system of elite policy actors, it is been constructed in public discourses as scientific fact. This false representation of the concept undermines opportunities for positive public engagement with the climate policy debate, yet it is strong public engagement which is a recurring aspiration of climate policy discourses and is considered essential if climate mitigation strategies are to work. Alongside a critical analysis of how the idea of a single dangerous limit has shaped our understanding of what sort of problem climate change is, the book explains how the public have been kept out of that decision making process, the implications of this marginalisation for climate policy and why the dangerous limit idea is undermining our ability to mitigate climate change. The book concludes by exploring possibilities for a deliberation about the future of the two degree limit which allows for public participation in the decision making process. This book illustrates why, at this critical juncture in the climate policy debate, the two degree limit idea has failed to achieve any of the policy goals intended. This is the first book dedicated to questioning the issue of the two degree limit within a social science framework and should be of interest to students and scholars of environmental policy and politics, climate change communication, and science, technology and society studies.

Immanuel Kant's Critique of Pure Reason is widely taken to be the starting point of the modern period of mathematics while David Hilbert was the last great mainstream mathematician to pursue important nineteenth century ideas. This two-volume work provides an overview of this important era of mathematical research through a carefully chosen selection of articles. They provide an insight into the foundations of each of the main branches of mathematics—algebra, geometry, number theory, analysis, logic and set theory—with narratives to show how they are linked. Classic works by Bolzano, Riemann, Hamilton, Dedekind, and Poincare are reproduced in reliable translations and many selections from writers such as Gauss, Cantor, Kronecker and Zermelo are here translated for the first time. The collection is an invaluable source for anyone wishing to gain an understanding of the foundation of modern mathematics.
