Elementary Statistics

Students in the sciences, economics, psychology, social sciences, and medicine take introductory statistics. Statistics is increasingly offered at the high school level as well. However, statistics can be notoriously difficult to teach as it is seen by many students as difficult and boring, if not irrelevant to their subject of choice. To help dispel these misconceptions, Gelman and Nolan have put together this fascinating and thought-provoking book. Based on years of teaching experience the book provides a wealth of demonstrations, examples and projects that involve active student participation. Part I of the book presents a large selection of activities for introductory statistics courses and combines chapters such as, 'First week of class', with exercises to break the ice and get students talking; then 'Descriptive statistics', collecting and displaying data; then follows the traditional topics - linear regression, data collection, probability and inference. Part II gives tips on what does and what doesn't work in class: how to set up effective demonstrations and examples, how to encourage students to participate in class and work effectively in group projects. A sample course plan is provided. Part III presents material for more advanced courses on topics such as decision theory, Bayesian statistics and sampling.

"To quote from pages 8 and 29 of the GAISE (Guidelines for Assessment and Instruction in Statistics Education) College Report 2016: "The desired result of all introductory statistics courses is to produce statistically educated students, which means that students should develop the ability to think statistically. The democratization of introductory statistics has broadened and diversified the backgrounds, interests, and motivations of those who take the course. Statistics is no longer reserved for future scientists in narrow fields but is now a family of courses, taught to students at many levels, with very diverse interests and goals." In writing and revising this text, the author has kept these comments and all recommendations of the GAISE report in mind to make this text helpful to students in a wide range of areas and at different levels. Introductory Statistics is written for a one- or two-semester first course in applied statistics. This book is intended for students who do not have a strong background in mathematics. The only prerequisite for this text is knowledge of elementary algebra"--

Applied Statistics for Economics and Business

Understanding Basic Statistics, AP* Edition

Based on over 30 years of successful teaching experience in this course, Robert Pagano's introductory text takes an intuitive, concepts-based approach to descriptive and inferential statistics. He uses the sign test to introduce inferential statistics, empirically derived sampling distributions, many visual aids, and lots of interesting examples to promote student understanding. One of the hallmarks of this text is the positive feedback from students -- even students who are not mathematically inclined praise the text for its clarity, detailed presentation, and use of humor to help make concepts accessible and memorable. Thorough explanations precede the introduction of every formula, and the exercises that immediately follow include a step-by-step model that lets students compare their work against fully solved examples. This combination makes the text perfect for students taking their first statistics course in psychology or other social and behavioral sciences. For the two-semester principles of economics course. An intuitive and grounded approach to economics Get students to think like an Economist using the latest policy and data while incorporating global issues. Microeconomics, Twelfth Edition builds on the foundation of the previous edition and retains a thorough and careful presentation of the principles of economics. Microeconomics emphasizes real-world applications, the development of critical thinking skills, diagrams renowned for pedagogy and clarity, and path-breaking technology. Each chapter opens with one of today's central issues and is then revisited in the chapter ending Economics in the News feature. This Parkin hallmark encourages student to think critically about a news article relating to the issue, demonstrating how thinking like an economist can bring a clearer perspective to and deeper understanding of today's events. Students will begin to think about issues the way real economists do and learn how to explore difficult policy problems to make more informed decisions in their own economic lives. The publication is the first in a new series on existing and innovative paradigms in Heritage Studies. The series aims at systematising and developing the academic discourse on heritage, which has yielded a wealth and breadth of contributions over the past few years. The publication offers its own emphasis by developing heritage studies with a perspective towards and as a contribution to human development. It thus offers a vision for the construction and establishment of a new discipline. The academic mainsprings and research interests of this repositioning of heritage studies as an academic discipline are discussed by internationally renowned thinkers and heritage practitioners. The publication thus establishes first important points for discussion. Central to this publication are questions concerning the sustainable protection and use of heritage, focussing on the world cultural heritage and intangible cultural heritage, but equally questions on the relation of heritage and memory and how these could mutually enrich our understanding of heritage.

Introductory Statistics: A Problem-Solving Approach by Stephen Kokoska combines a traditional, classic approach to teaching statistics with contemporary examples, pedagogical features, and prose that will appeal to today's student. Kokoska emphasizes statistical inference and decision making throughout. His fresh yet practical way to help students understand statistics is balanced by a logic that speaks to the teaching style of many instructors. Introductory Statistics: A Problem-Solving Approach has been extensively reviewed and class tested and feedback from instructors and students has shaped it throughout its development. Author Steve Kokoska blends solid mathematics with lucid writing to create a text that illustrates statistical concepts by using a stepped problem-solving approach. His textbook helps students understand the process of basic statistical arguments, a skill that will help them in their coursework and as they enter a life beyond academics. The driving philosophy of Introductory Statistics: A Problem-Solving Approach is simple: statistics is often hard for students but, when presented in an orderly, precise, friendly manner (and with some humor), statistics can change the way students think about math and about the world around them

Understanding Basic Statistics Notetaking Guide

STAT2 introduces students to statistical modeling beyond what they have learned in a Stat 101 college course or an AP Statistics course. Building on basic concepts and methods learned in that course, STAT2 empowers students to analyze richer datasets that include more variables and address a broader range of research

questions. Other than a working understanding of exponential and logarithmic functions, there are no prerequisites beyond successful completion of their first statistics course. To help all students make a smooth transition to this course, Chapter 0 reminds students of basic statistical terminology and also uses the familiar two-sample t-test as a way to illustrate the approach of specifying, estimating, and testing a statistical model. Using STAT2, students will: Go beyond their Stat 101 experience by learning to develop and apply models with both quantitative and categorical response variables, and with multiple explanatory variables. STAT2 Chapters are grouped into units that consider models based on the type of response and type of predictors. Discover that the practice of statistical modeling involves applying an interactive process. STAT2 employs a four-step process in all statistical modeling: Choose a form for the model, fit the model to the data, assess how well the model describes the data, and use the model to address the question of interest. Learn how to apply their developing judgment about statistical modeling. STAT2 introduces the idea of constructing statistical models at the very beginning, in a setting that students encountered in their Stat 101 course. This modeling focus continues throughout the course as students encounter new and increasingly more complicated scenarios. Analyze and draw conclusions from real data, which is crucial for preparing students to use statistical modeling in their professional lives. STAT2 incorporates real and rich data throughout the text. Using real data to address genuine research questions helps motivate students to study statistics. The richness stems not only from interesting contexts in a variety of disciplines, but also from the multivariable nature of most datasets.

Teaching Statistics

This textbook introduces readers to practical statistical issues by presenting them within the context of real-life economics and business situations. It presents the subject in a non-threatening manner, with an emphasis on concise, easily understandable explanations. It has been designed to be accessible and student-friendly and, as an added learning feature, provides all the relevant data required to complete the accompanying exercises and computing problems, which are presented at the end of each chapter. It also discusses index numbers and inequality indices in detail, since these are of particular importance to students and commonly omitted in textbooks. Throughout the text it is assumed that the student has no prior knowledge of statistics. It is aimed primarily at business and economics undergraduates, providing them with the basic statistical skills necessary for further study of their subject. However, students of other disciplines will also find it relevant.

Public Speaking: Concepts and Skills for a Diverse Society

The goals of STATISTICS FOR THE BEHAVIORAL SCIENCES, 10th Edition are to teach the methods of statistics and convey the basic principles of objectivity and logic that are essential for science -- and valuable in everyday life. Authors Frederick Gravetter and Larry Wallnau help students understand statistical procedures through a conceptual context that

explains why the procedures were developed and when they should be used. Students have numerous opportunities to practice statistical techniques through learning checks, examples, step-by-step demonstrations, and problems. This book examines the process of conducting research on parental involvement in an effort to promote academic achievement across all school levels, income levels, and racial lines, theories, and research. Latunde explores the policies that have emerged to support the role of families and home-school collaboration in the education of youth, and evidence supporting home school collaboration and the need for parental involvement to improve student outcomes. She defines parental research and its role in our understanding of parental involvement and student outcomes and examines federal and state mandates for parental involvement and shares specific parental involvement resources. The nuances in parental involvement are critical to understanding the roles family play in the academic achievement youth, and how schools may partner with parents for success.

Bernard Rosner's FUNDAMENTALS OF BIostatISTICS is a practical introduction to the methods, techniques, and computation of statistics with human subjects. It prepares students for their future courses and careers by introducing the statistical methods most often used in medical literature. Rosner minimizes the amount of mathematical formulation (algebra-based) while still giving complete explanations of all the important concepts. As in previous editions, a major strength of this book is that every new concept is developed systematically through completely worked out examples from current medical research problems. Most methods are illustrated with specific instructions as to implementation using software either from SAS, Stata, R, Excel or Minitab.
