Industrial Wastewater Treatment, Recycling and Reuse

Wastewater treatment is necessary but requires investments, and the countries more in need of improvements are often those with lower capacity of investment, also related to the affordability of the service for the poor. The JRC has commissioned two feasibility studies concerning the setup of "synthesis centres", to address one feasibility study relative to small decentralized wastewater treatment solutions in a rural area of Slovenia, and another feasibility study relative to a centralized wastewater treatment solution for two municipalities in Serbia. A "Synthesis centre" is meant in this report as the ad hoc gathering of stakeholders, service operators, government and the local community around the problem to be solved. The wastewater treatment solutions designed and discussed in these two feasibility studies have been further tested in a set of additional cases in all countries of the Lower Danube. The outcomes suggest that there is considerable scope for the development of decentralized wastewater treatment through constructed wetlands in rural areas and small

agglomerations, throughout the Lower Danube. This type of solution offers significantly higher cost-effectiveness than more "technological" and centralized solutions, particularly because it limits the costly investments of sewage collection and the energy and labour requirements of activated sludge or similar processes. In cases where a centralized plant is justified, this can become the pivot of an "industrial ecological" district where the energy and materials conveyed by wastewater can be conveniently recovered. For energy the benefits are more apparent, while the recovery of fertilizers and water may be limited by lack of a market for these secondary resources, the still relatively high costs, and cultural and legislative barriers hampering their marketability. At the same time, often the sludge line of wastewater treatment plants may be synergetic with the treatment of the organic fraction of municipal, industrial and agricultural waste. When this is the case, expanding the boundaries of the system of waste flows considered in the design of the plant may result in significant economies of scale and revenues offsetting parts of the costs of waste and wastewater treatment. The study highlights that wastewater tariffs may be relatively low even by standards of middle income countries; however, the large variation of income within countries may give rise to affordability issues. The strategies analysed here may improve the financial sustainability and affordability of the service. Generally speaking, the involvement of stakeholders in a "synthesis centre" may stimulate the invention of more integrative solutions for affordable and cost-effective wastewater treatment, and can be recommended in order to unleash this potential.

Paper recycling in an increasingly environmentally conscious world is gaining importance. Increased recycling activities are being driven by robust overseas markets as well as domestic demand. Recycled fibers play a very important role today in the global paper industry as a substitute for virgin pulps. Paper recovery rates continue to increase year after year. Recycling technologies have been improved in recent years by advances in pulping, flotation deinking and cleaning/screening, resulting in the quality of paper made from secondary fibres approaching that of virgin paper. The process is a lot more eco-friendly than the virgin-papermaking process, using less energy and natural resources, produce less solid waste and fewer atmospheric emissions, and helps to preserve natural resources and landfill space. Currently more than half of the paper is produced from recovered papers. Most of them are used to produce brown grades paper and board but for the last two decades, there is a substantial increase in the use of recovered papers to produce, through deinking, white grades such as newsprint, tissue, market pulp. By using recycled paper, companies can take a significant step toward reducing their overall environmental impacts. This study deals with the scientific and technical advances in recycling and deinking including new developments. Covers in great depth all the aspects of recycling technologies Covers the latest science and technology in recycling Provides up-to-date, authoritative information and cites many mills experiences and pertinent research Includes the use of biotech methods for deinking, refining. and improving drainage

Wastewater Treatment is another indispensable work from the author of Water Treatment. Both books are helpful tools for crisis identification and, most importantly, resolution. Tillman writes in a concise, well organized format - perfect for fast reference. This operator's guide presents basic troubleshooting and problem solving information for typical problems that can occur during the operation of processes used at municipal and industrial wastewater treatment plants. Common problems and the recommended operator responses are listed in tabular form for individual unit processes. Entry level operators will benefit greatly from the problems Tillman addresses, while experienced operators will appreciate it as a handy reference. The information compiled in this volume has been collected from various equipment manufacturers' operation and maintenance manuals, U.S. Environmental Protection Agency (EPA) technology transfer documents, the authors personal experience as a plant Operations and Maintenance manual writer, and his experience as a plant manager and operator. He includes only the most common wastewater treatment unit processes. He gives an overview of the treatment objective of the unit process, and then provides each with a troubleshooting table divided into Indicators/Observations: Possible Cause; Check or Monitor; Possible Solutions columns. Wastewater Treatment reads like the best of training manuals. Tillman's know-how, combined with his clarity, make this book required occupational reading. The brief, straightforward format and easy-to-read tables make the guide an accessible problem solving reference.

Wastewater Treatment in the Danube Region

Hazardous waste is a waste with properties that make it dangerous or potentially harmful to human health or the environment. Hazardous waste generally exhibits one or more of these characteristics: ignitability, corrosivity, reactivity or toxicity. The universe of hazardous wastes is large and diverse. Hazardous wastes can be liquids, solids, contained gases, or sludges. They can be the by-products of manufacturing processes or simply discarded commercial products, like cleaning fluids or pesticides. One major type is radioactive waste. This book brings together the latest research in this diverse field.

Water is accepted as the most important source of life. It is assumed that life began in water and spread from there to the whole world. But water has been polluted anthropogenically since the beginning of the industrial revolution in the late 19th century. At the end of the 20th century, most water sources cannot be used for aquaculture, irrigation, and human use. Therefore, for sustainable development, we have to protect our water sources on Earth, because it's the only planet we have!

Domestic Wastewater Treatment in Developing Countries

Stable, safe, secure and readily available water supply is one of the key factors in ensuring a good level of the public health and a stable society. Scientific assessments show that about 80 % of diseases and one-third of the total death toll in the developing countries are caused by the low quality of the drinking water. Other countries are also suffering from water shortages and insufficient quality of the drinking water. Many rivers in Europe and in other parts of the world are significantly polluted by insufficiently treated or untreated wastewater discharge. This book is based on the discussions and papers prepared for the NATO Advanced Research Workshop that took place in Lviv, Ukraine, and addressed recent advances in water supply and wastewater treatment as a prerequisite for a safer society and environment. The contributions critically assess the existing knowledge on urban water management and provide an overview of the current water management issues, especially in the countries in transition in Central and Eastern Europe and in the Mediterranean Dialogue countries.

Wastewater Treatment and Waste Management

An excellent, concise, and interdisciplinary overview of different classes of emerging pollutants arising, for example, from pharmaceuticals, pesticides, personal care products, and industrial chemicals and their impact on water, soil, and air. Following an introduction to chemical pollutants, with special attention focused on organic compounds and their properties, the book goes on to describe major emerging pollutants grouped according to their applications in different sectors of industrial or economic activity. For each type of compound, the chemical structure, main properties, and source are presented, along with their fate in the environment as pollutants, the latest analytical methods for detection, possible health or ecology consequences, as well as current regulatory laws. New developments, such as nanotechnology as a pollution source, are also included. The book closes with a chapter devoted to conclusions and future perspectives.

Water and Wastewater Treatment

The sustainable management of waste water should aim at pollution prevention and reduction first, followed by resource

recovery and reuse. This work shows that substantial water quality improvements could be achieved through a so-called 3-Step Strategic Approach. The frameworks developed in this research for managing water on-site and at centralized and decentralized levels can be used in re-designing current systems or designing new systems that make optimal use of wastewater components whilst minimising pollution.

Physicochemical Methods for Water and Wastewater Treatment

Due to increasing demand for potable and irrigation water, water suppliers have to use alternative resources. They either have to regenerate wastewater or deal with contaminated surface water. This book brings together the experiences of various experts in preparing of innovative materials that are selective for arsenic and chromium removal, and inventing some innovative processes to extract these elements from water. The book should be of high interest to engineers and decision-makers responsible for production and delivery of safe water. The book is divided into three parts. The first one shows the effect of arsenic and chromium ions on living organisms. The second one presents the studies on preparation of innovative materials with improved affinity towards arsenic as well as chromium. The third part shows the innovative methods for removal of these toxic elements, with special attention paid to chromatographic, membrane, and hybrid systems. The book is the first ever scientific work addressed to two most harmful elements appearing in water and provides a comprehensive review of materials and methods useful for making the water safe. The book discusses in detail the various fabrication techniques for sorbents and membranes that are now commercially available or appear in the development stage and will be commercialized in the next decades. Some of the technologies described in the third part will be implemented at the industrial scale in the future as well.

Nanotechnology in Water and Wastewater Treatment
